

# ←2 Drive→

## Forked Chain Sprockets

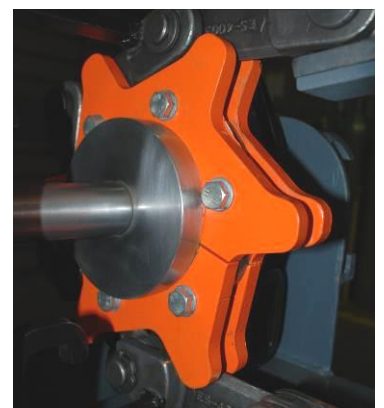

The specific design of the new ←2 Drive→ wheel segments ensures that these wheel segments can be mounted in the 2 driving directions.

### Advantages:

- ☑ **Doubling lifetime**  
Through the symmetric design of the surfaces of the teeth, the wheel segments can be turned easily after the first lifecycle. The lifetime is doubled.
- ☑ **Cheaper**  
The price of a 2-Drive wheel segment set is significantly lower than the price of two conventional wheel segment sets.
- ☑ **Less stock**  
Given the tooth segments can be reversed, you can maintain less stock levels or even no stock.
- ☑ **Symmetrical design**  
The hardened tooth surfaces and the chamfered edge of the teeth are provided on both sides. Completely symmetrical.
- ☑ **100% compatible**  
The segments are mounted on the existing hubs. No adjustment is required in the existing system.
- ☑ **Available for all versions**  
The tooth segments are available for all types of forked chains, for wheels with different number of teeth and pcd's.
- ☑ **Non symmetrical axes & hubs**  
Mistakes with non symmetrical designed hub diameters belong to the past through the symmetrical design of the teeth.

2-Drive wheel segments for forked chains
